Boolean Algebra

George Boole
1815-1864

- An algebraic structure consists of
 - a set of elements {0, 1}
 - binary operators {+, •}
 - and a unary operator {'} or { \neg } or {~}
- Introduced by George Boole in 1854
- An effective means of describing circuits built with switches
- A powerful tool that can be used for designing and analyzing logic circuits

Different Notations for Negation

- All three of these mean “negate x”

- \bar{x} ,

- \overline{x}

- $\sim x$

Axioms of Boolean Algebra

DeMorgan's Theorem

Generalizes to more than 2 variables

$$\overline{\overline{x} \cdot y \cdot z} = \overline{\overline{x}} + \overline{\overline{y}} + \overline{\overline{z}}$$

$$\overline{\overline{x + y + z}} = \overline{\overline{x}} \cdot \overline{\overline{y}} \cdot \overline{\overline{z}}$$

DeMorgan's Theorem

Generalizes to more than 2 variables

$$\overline{a \cdot b \cdot c \cdot d} = \overline{a} + \overline{b} + \overline{c} + \overline{d}$$

$$\overline{a + b + c + d} = \overline{a} \cdot \overline{b} \cdot \overline{c} \cdot \overline{d}$$

Try to prove these ones at home

16a. $x + \bar{x} \cdot y = x + y$

16b. $x \cdot (\bar{x} + y) = x \cdot y$

17a. $x \cdot y + y \cdot z + \bar{x} \cdot z = x \cdot y + \bar{x} \cdot z$

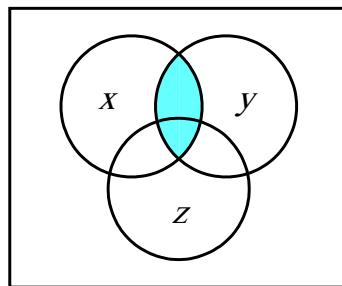

17b. $(x+y) \cdot (y+z) \cdot (\bar{x}+z) = (x+y) \cdot (\bar{x}+z)$

Venn Diagram Example

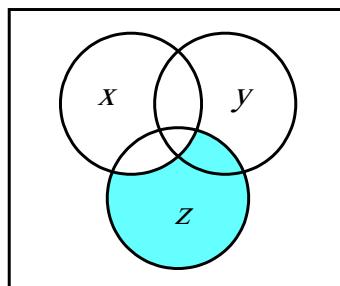

Proof of Property 17a

$$17a. \quad x \cdot y + y \cdot z + \bar{x} \cdot z = x \cdot y + \bar{x} \cdot z$$

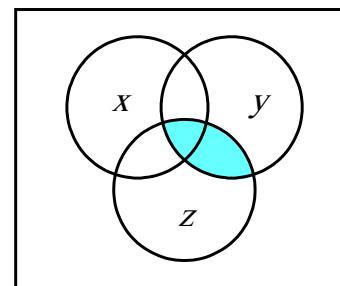

Left-Hand Side

$$\overline{X}Z$$

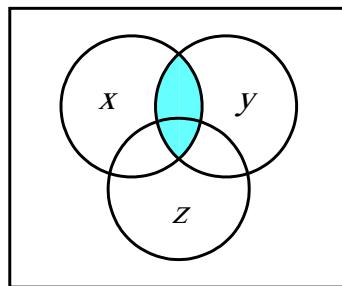

$$YZ$$

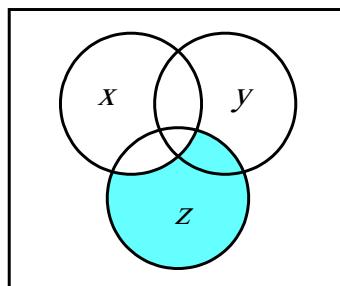

$$XY + \overline{X}Z + YZ$$

$$XY$$

$$\bar{X}Z$$

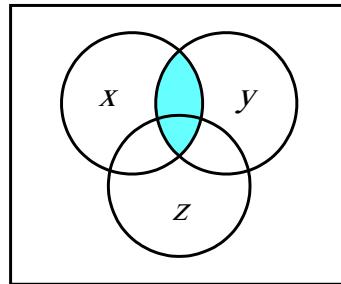

$$YZ$$

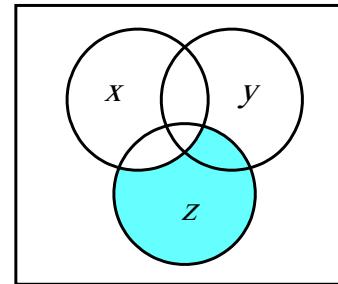

$$XY + \bar{X}Z + YZ$$

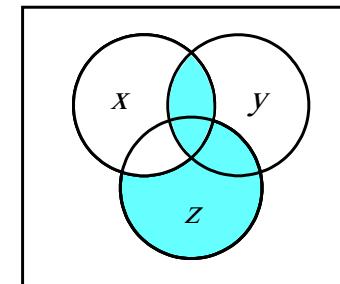

Right-Hand Side

$$XY$$

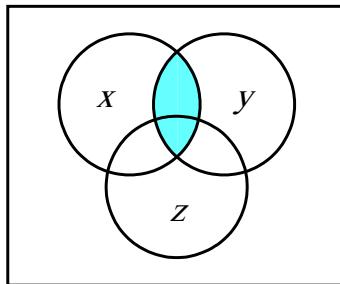

$$\bar{X}Z$$

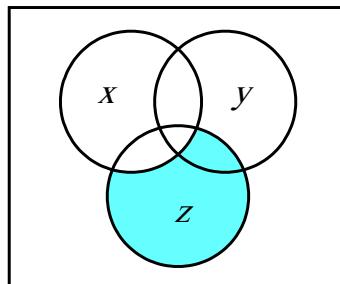

$$X - Y + \bar{X}Z$$
