

PLAN IOWA ENERGY (PIE)

Evaluating & Strengthening Iowa's Power Grid for High Wind/Solar Penetration Levels
A 3-Year Project

Add Maison Blead of IUB to
future meeting announcements
(per Sarah Martz).

Project Advisory Board Meeting

Wednesday, March 27, 2024, 10am-noonCT

James McCalley, Colin Christy, Ali Jahanbani,
Investigators

Gustavo Cuello-Polo, Yanda Jiang, Aladdin Adam,
Ph. D. Students

Dut Ajang, M.S. Student

Contact info: jdm@iastate.edu; 515-460-5244

PAB Feedback

Please jot down your questions/comments during my presentation.
Or consider to enter them to the chat.

We do want your feedback! Provide it during discussion 11-12 or else by e-mail to jdm@iastate.edu or phone at 515-294-4844 (v) or 515-460-5244 (cell) at any time after the meeting, but within next 2-3 days.

Some questions of particular interest:

1. Do you see ways to modify our current work or next steps to make this project more valuable to you and/or to Iowa?
2. Do you find our report #3 useful/informative? Do you have questions related to it?
3. Any other questions, comments, suggestions, opinions you have?

Meeting Agenda

1. Review key project features & previous work

- Objective, power system design tool
- Visions/uncertainties/futures/plans
- Summary of previous work

2. New report on visions/uncertainties/futures

(see report #3 at <https://home.engineering.iastate.edu/~jdm/pie/index.htm>)

3. Progress on model development

- Modeling process
- Technology options considered

4. Recent work

- Including resource adequacy
- Including inertial/frequency constraints
- New nuclear
- Providing grid services
- Iowa's preferences

5. Next steps

6. PAB feedback & discussion (last hour)

Objective:

Identify several 25-year investment plans to position Iowa's electric infrastructure to perform well under normal & climate-influenced extreme events & conditions.

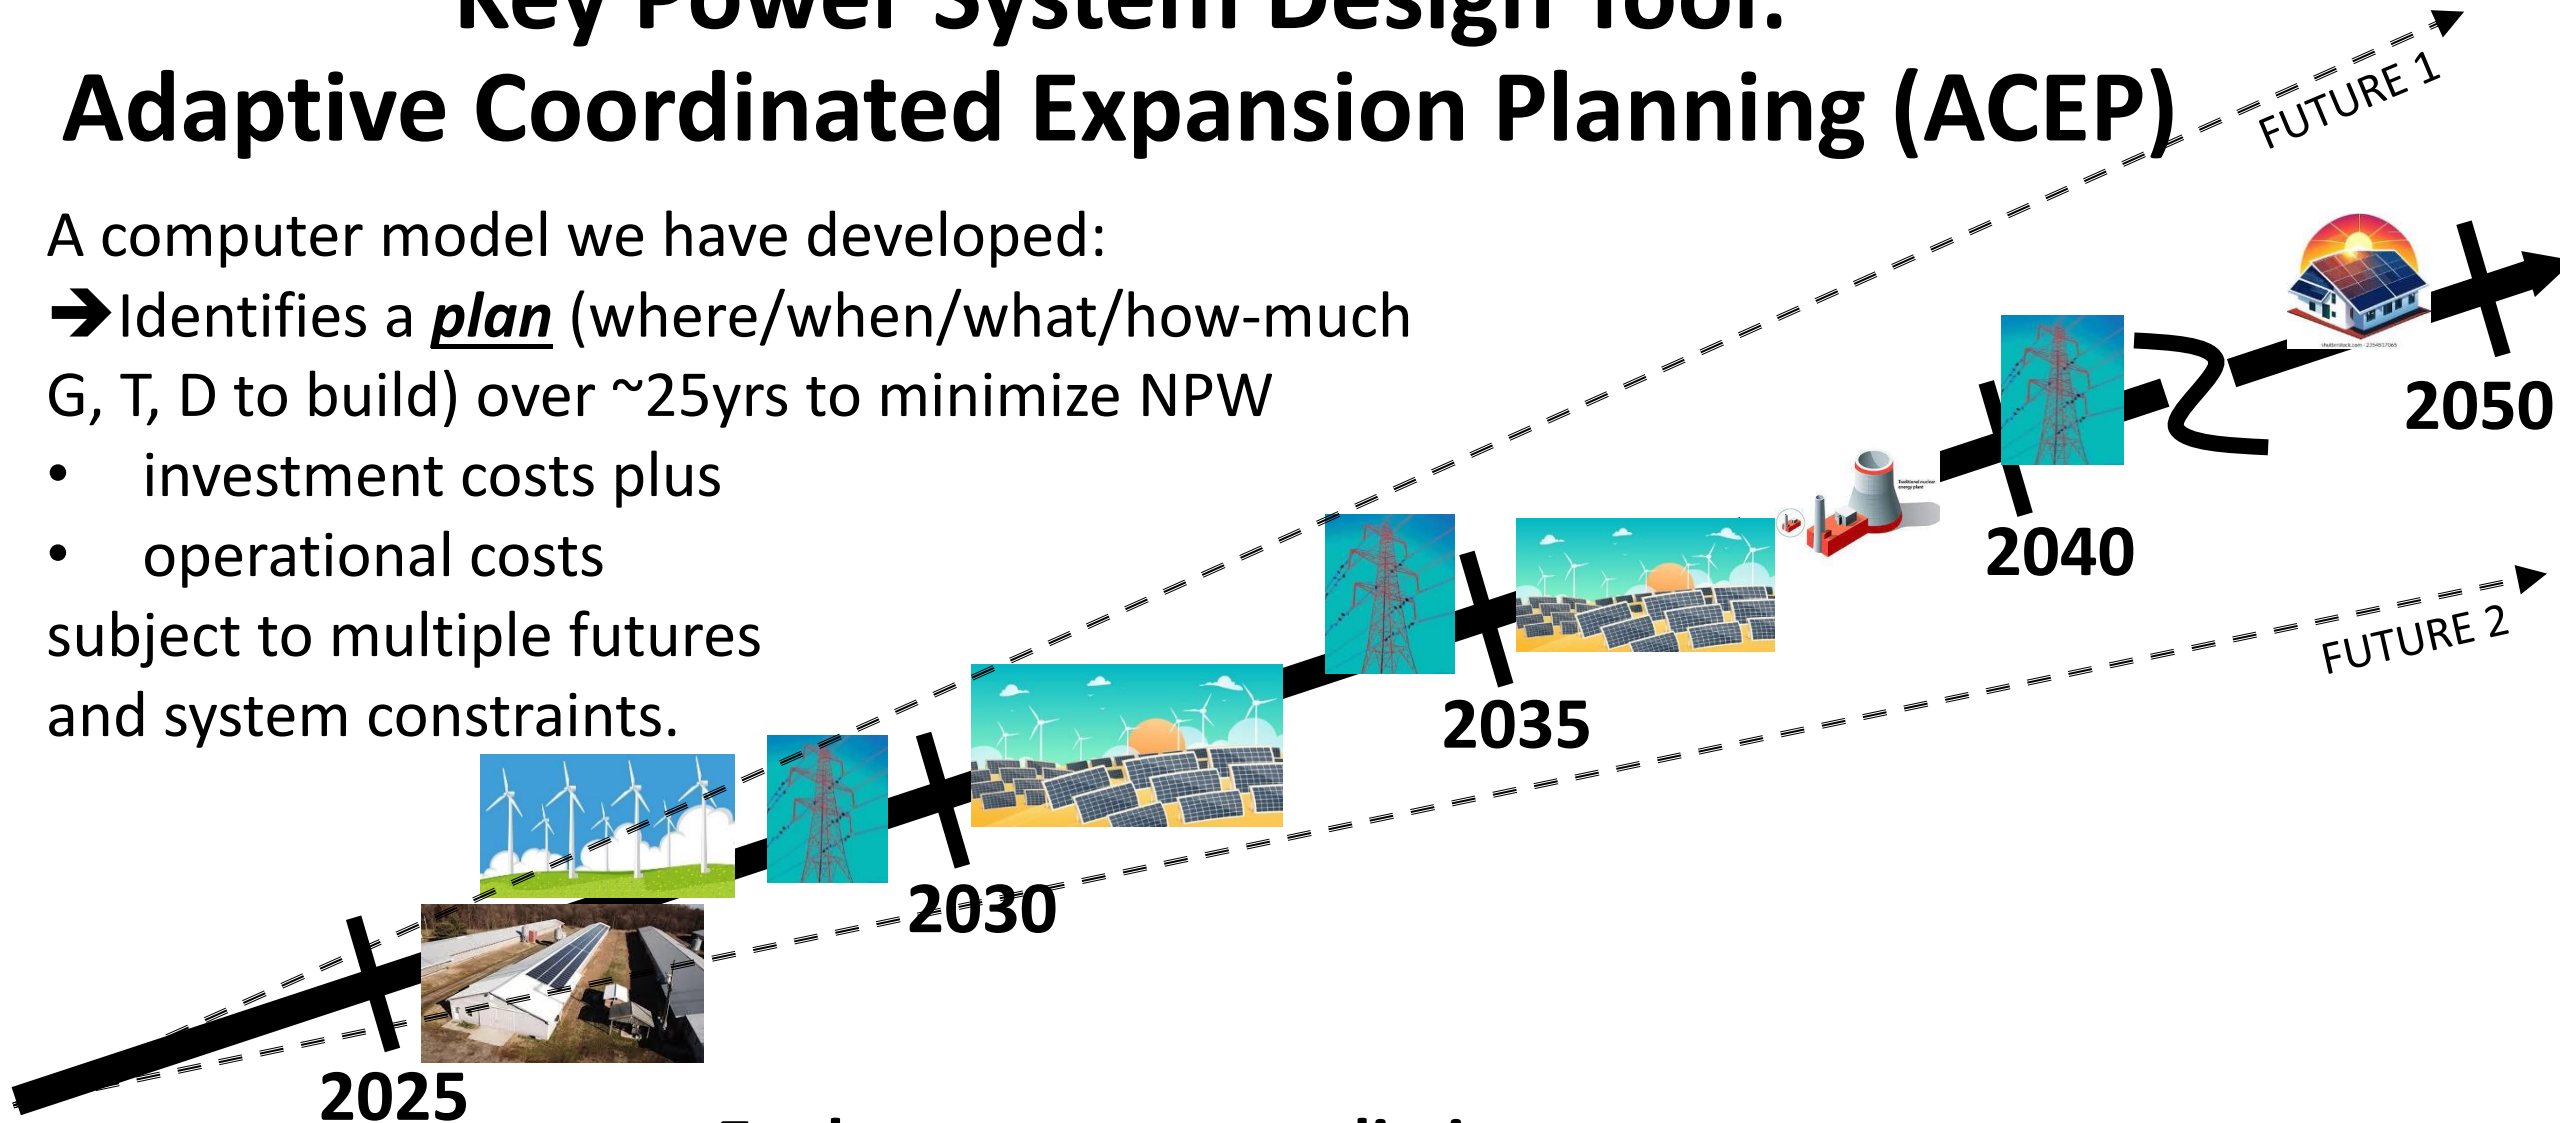

Organization	Person	Title
STATE AGENCIES		
Iowa Economic Development Authority	Stephanie Weisenbach	Program Manager
Iowa Utilities Board	Sarah Martz	Board Member
Iowa Utilities Board	Edgard Verdugo	Utilities Regulatory Engineer
Iowa Office of the Consumer Advocate	Tim Tessier	Utility Specialist
Iowa Department of Transportation	Sam Sturtz	Chair, Iowa DOT Resiliency WG
OTHER AGENCIES		
Iowa Association of Municipal Utilities	Troy DeJoode	Executive Director
Iowa Association of Elect. Cooperatives	Ethan Hohenadel	Regulatory Affairs Director
Iowa Utility Association	Chaz Allen	Executive Director
Iowa Environmental Council	Steve Guyer	Energy Policy Manager
Iowa Industrial Energy Group	Amanda James	Executive Director
Iowa State Institute for Transportation	Shauna Hallmark	Director
REGIONAL TRANSM. ORGANIZATIONS		
Midcontinent Independent Sys Operator	Armando Figueroa-Acevedo	Sr. Engr., Strategic Assessments
Southwest Power Pool	Sunny Raheem Clint Savoy	Manager, Planning Policy&Rsrch; Manager, Interregional Strategy
INVESTOR-OWNED UTILITIES		
Alliant Energy	Mike Graves	Lead Engineer
MidAmerican Energy	Dehn Stevens	VP, Transm Planning & Dvlpmnt
ITC Transmission Midwest	Rob Wells	Supervisor, Planning
MUNICIPAL UTILITIES		
City of Ames Electric	Don Kom	Director
Cedar Falls Utilities	Ken Kagy	Principle Transmission Engineer
Muscatine Power and Water	Ryan Streck	Director, Utility Service Delivery
COOPERATIVE UTILITIES		
Central Iowa Power Cooperative	Ethan Tellier	Planning engineer
Corn Belt Power Cooperative	Tyler Baxter	Engineer III
Dairyland Power Cooperative	Ben Porath	Chief Operating Officer
Maquoketa Valley Electrical Cooperative	Nik Schulte	Distribution system manager

Key Power System Design Tool: Adaptive Coordinated Expansion Planning (ACEP)

A computer model we have developed:

→ Identifies a **plan** (where/when/what/how-much G, T, D to build) over ~25yrs to minimize NPW

- investment costs plus
 - operational costs
- subject to multiple futures and system constraints.

Exploratory, not predictive:

We “point it” in the direction of a particular vision.

We identify several “futures”.

It gives least-cost G,T,D plan for that vision subject to specified futures & sys constraints.

VISIONS

UNCERTAINTIES FUTURES

PLANS

Vision 1 →

Emphasize energy cost

Maintain avg annual R/C/I cost of 12, 10, 6 ¢/kwh (EIA).

Uncertainties
Policies (i.e. emissions, RPS)
Demand growth
Retirements
Fuel price
Technology investment costs

Future 1
Future 2
⋮
Future n-1
Future n

PLAN 1

Vision 2 →

Emphasize CO2 reduction

Cut 2025 CO₂ levels from electric/transportation by 90%

Uncertainties
Policies (i.e. emissions, RPS)
Demand growth
Retirements
Fuel price
Technology investment costs

Future 1
Future 2
⋮
Future n-1
Future n

PLAN 2

Vision 3 →

Emphasize energy export

Produce 1.5 times in-state electric energy requirements.

Uncertainties
Policies (i.e. emissions, RPS)
Demand growth
Retirements
Fuel price
Technology investment costs

Future 1
Future 2
⋮
Future n-1
Future n

PLAN 3

Vision 4 →

Emphasize resilience

Reduce extreme event cost of electric outages by 60%.

Uncertainties
Policies (i.e. emissions, RPS)
Demand growth
Retirements
Fuel price
Technology investment costs

Future 1
Future 2
⋮
Future n-1
Future n

PLAN 4

Vision 5 →

Balanced

Seek a balanced portfolio of above 4 features.

Uncertainties
Policies (i.e. emissions, RPS)
Demand growth
Retirements
Fuel price
Technology investment costs

Future 1
Future 2
⋮
Future n-1
Future n

PLAN 5

EVALUATE:

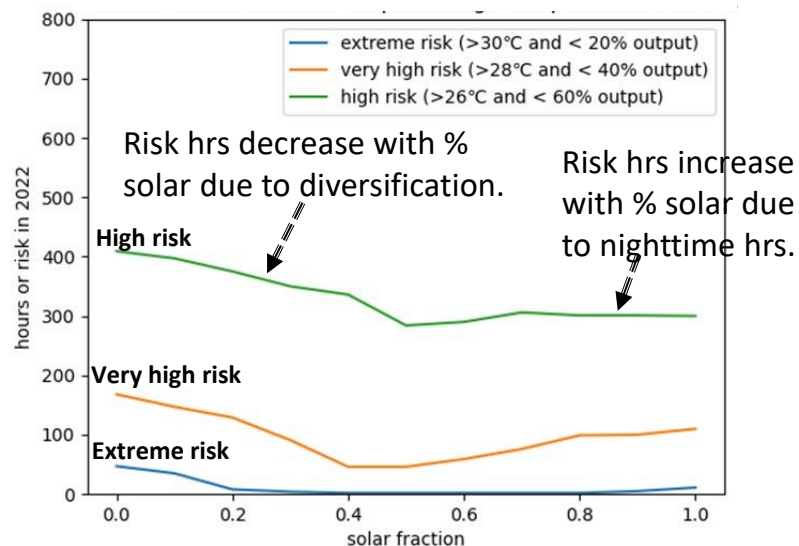

- Reliability
- Resilience
- Robustness
- Investment & Op cost
- Econ. dvlpmnt impact
- Environmental impact

Summary of previous work

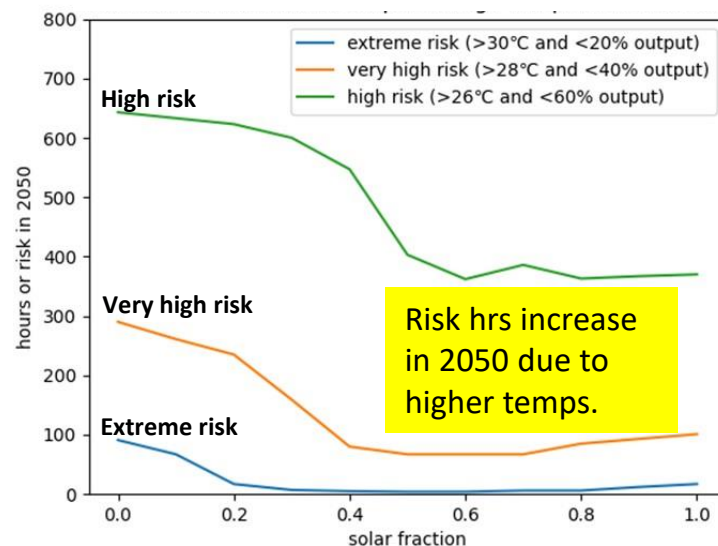

- Project Report #1: MISO & SPP planning processes
- Project Report #2: High-risk conditions & events

<https://home.engineering.iastate.edu/~jdm/pie/index.htm>

2022

2050

High-risk conditions (high temp & low wind/solar)

Number of severe storms in Iowa having cost impact exceeding \$1B

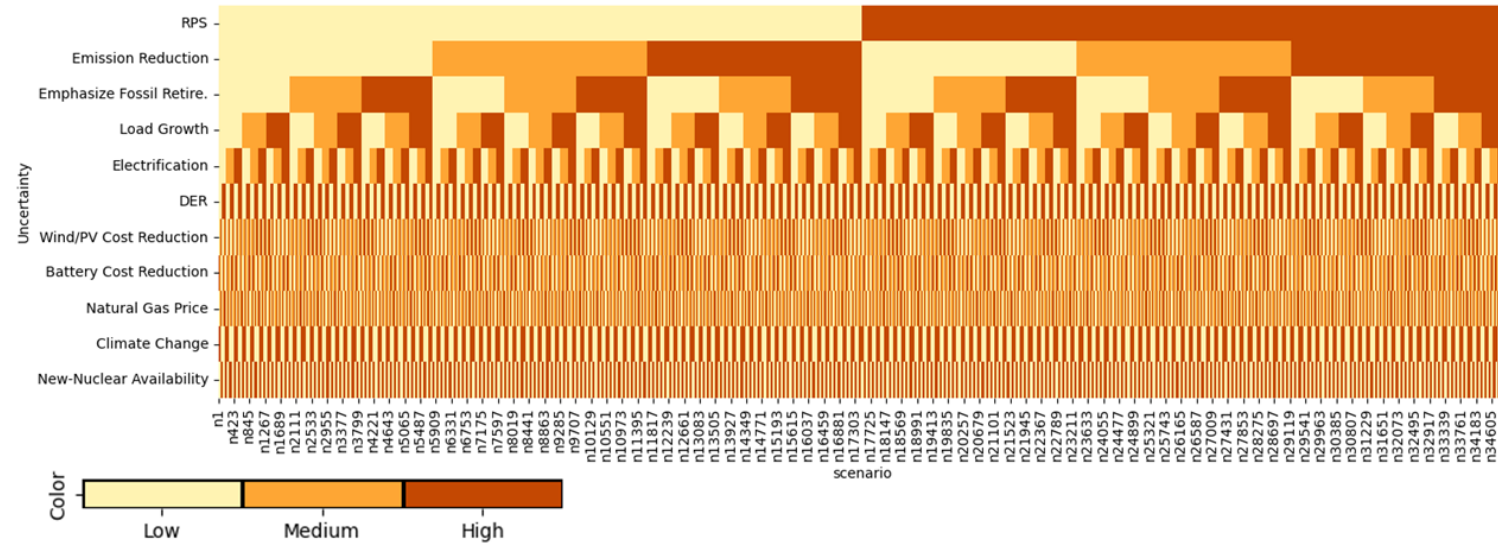

Extreme events (very high wind)

New report on visions/uncertainties/futures

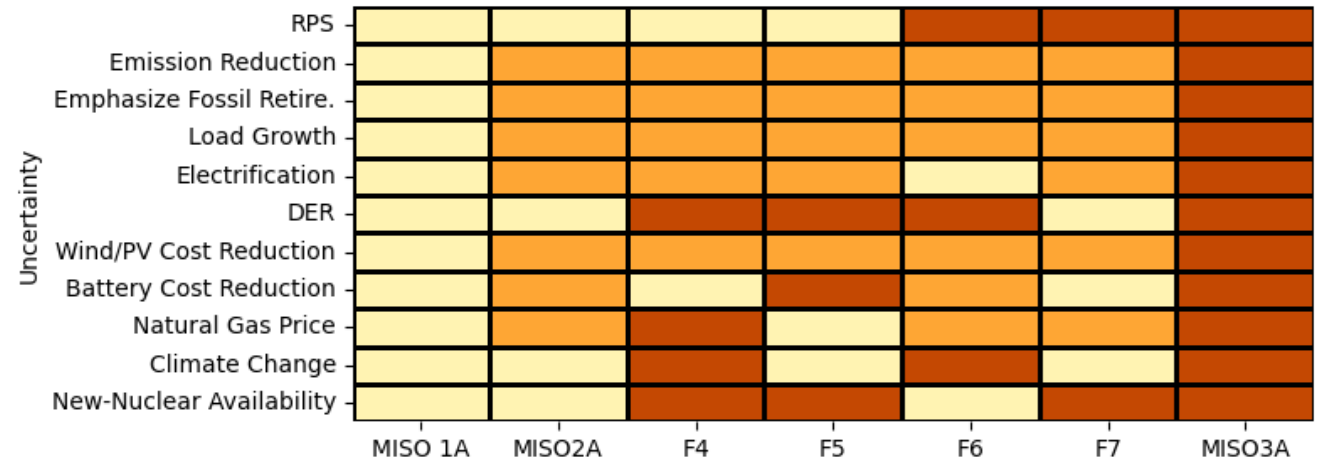

Uncertainties based
on MISO Series 1A Futures +

Parameter	No. of values	Value 1	Value 2	Value 3	Uncertain in MISO L RTP Futures?
RPS	2	0		50	Yes
Carbon Reduction (%)	3	71	76	80	Yes
Load Growth Energy (CAGR)	3	Low	Medium	High	Yes
Demand (CAGR)		0.63%	1.25%	1.95%	
Electrification (% of total energy growth)	3	2.0	15.2	31.8	Yes
Emphasis on Fossil Retirement	3	Low	Medium	High	Yes
DER:	2	Low		High	Yes
Wind/PV costs reduction	3	0.75	1	1.25	No
Battery Costs Reduction	3	Low	Medium	High	No
Natural Gas Price	3	Low (0.75)	Medium (1.0)	High (1.25)	No
Climate Change	2	Low		High	No
New-Nuclear Investible?	2	Low (No)		High (in 2040)	No
Discount Rate	N/A				No

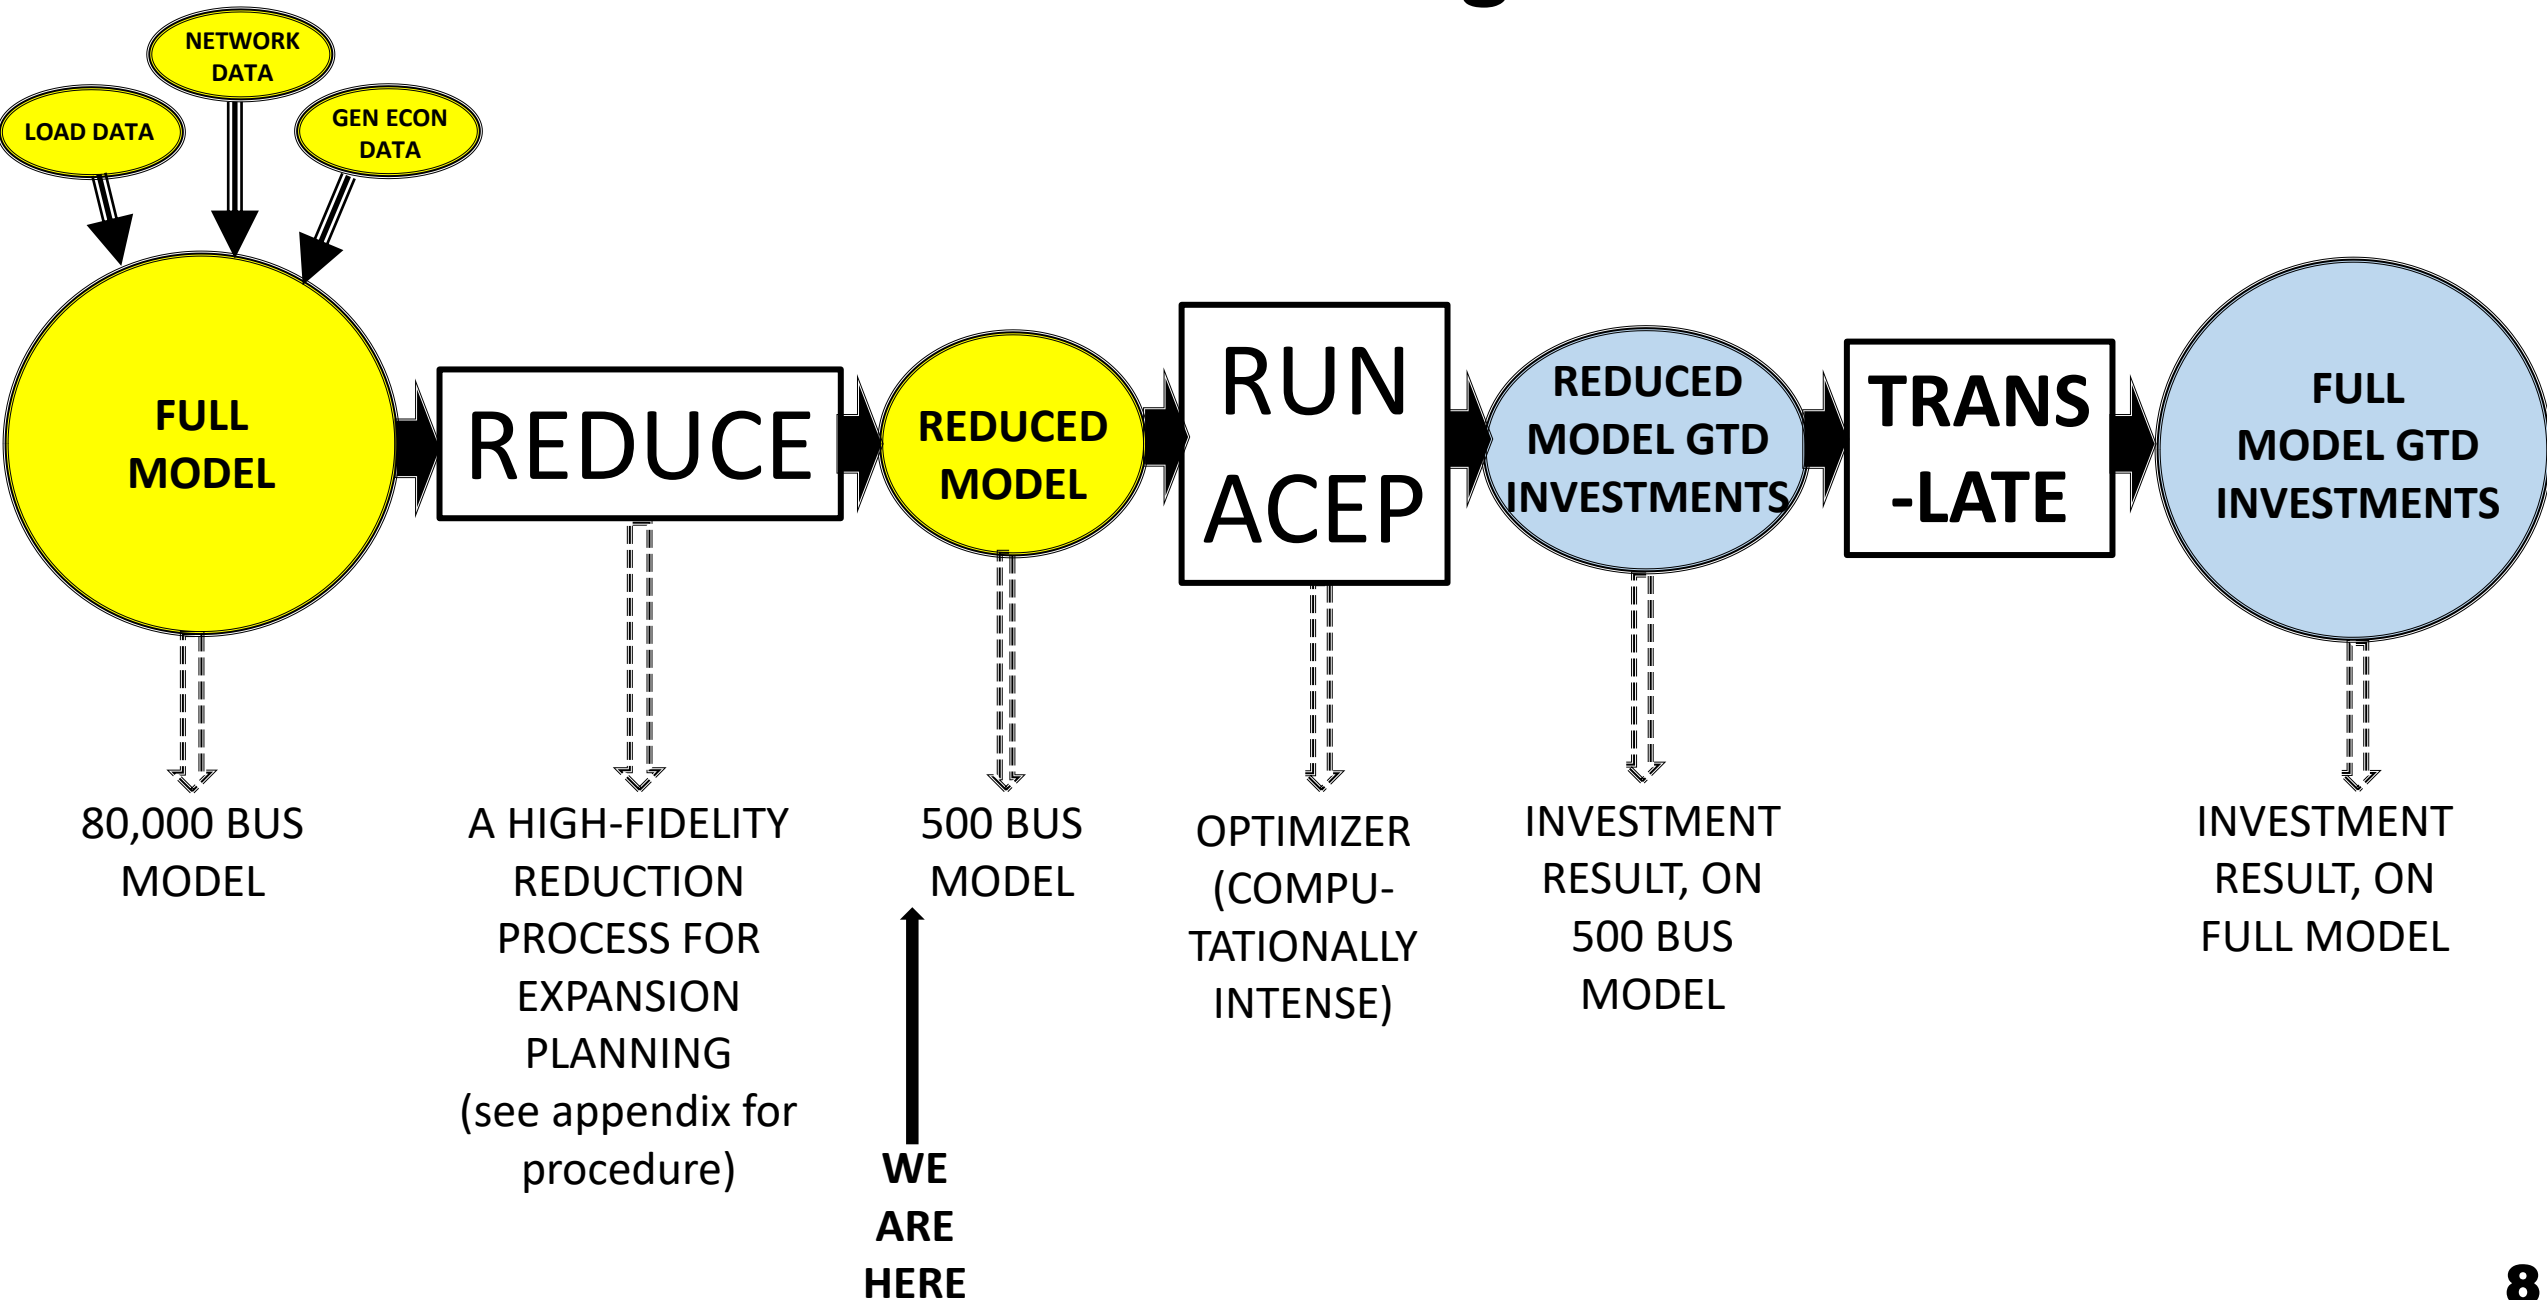

11 Uncertainties yield 34,992 potential futures!

Scenario reduction algorithm to find 7 best.

Network Modeling Process

Technology options considered

Generation resources:

- Wind
- Solar
- Gas-CTs w&w/o CCS
- Gas-NGCC w&w/o CCS
- Coal with CCS
- Nuclear – SMR
- Reciprocating ICEs
- DER:
 - Res, Com, Ind rooftop solar
 - Community solar
 - Energy efficiency
 - Demand response

Storage:

- Bulk hydrogen
- Bulk battery
- Distributed battery

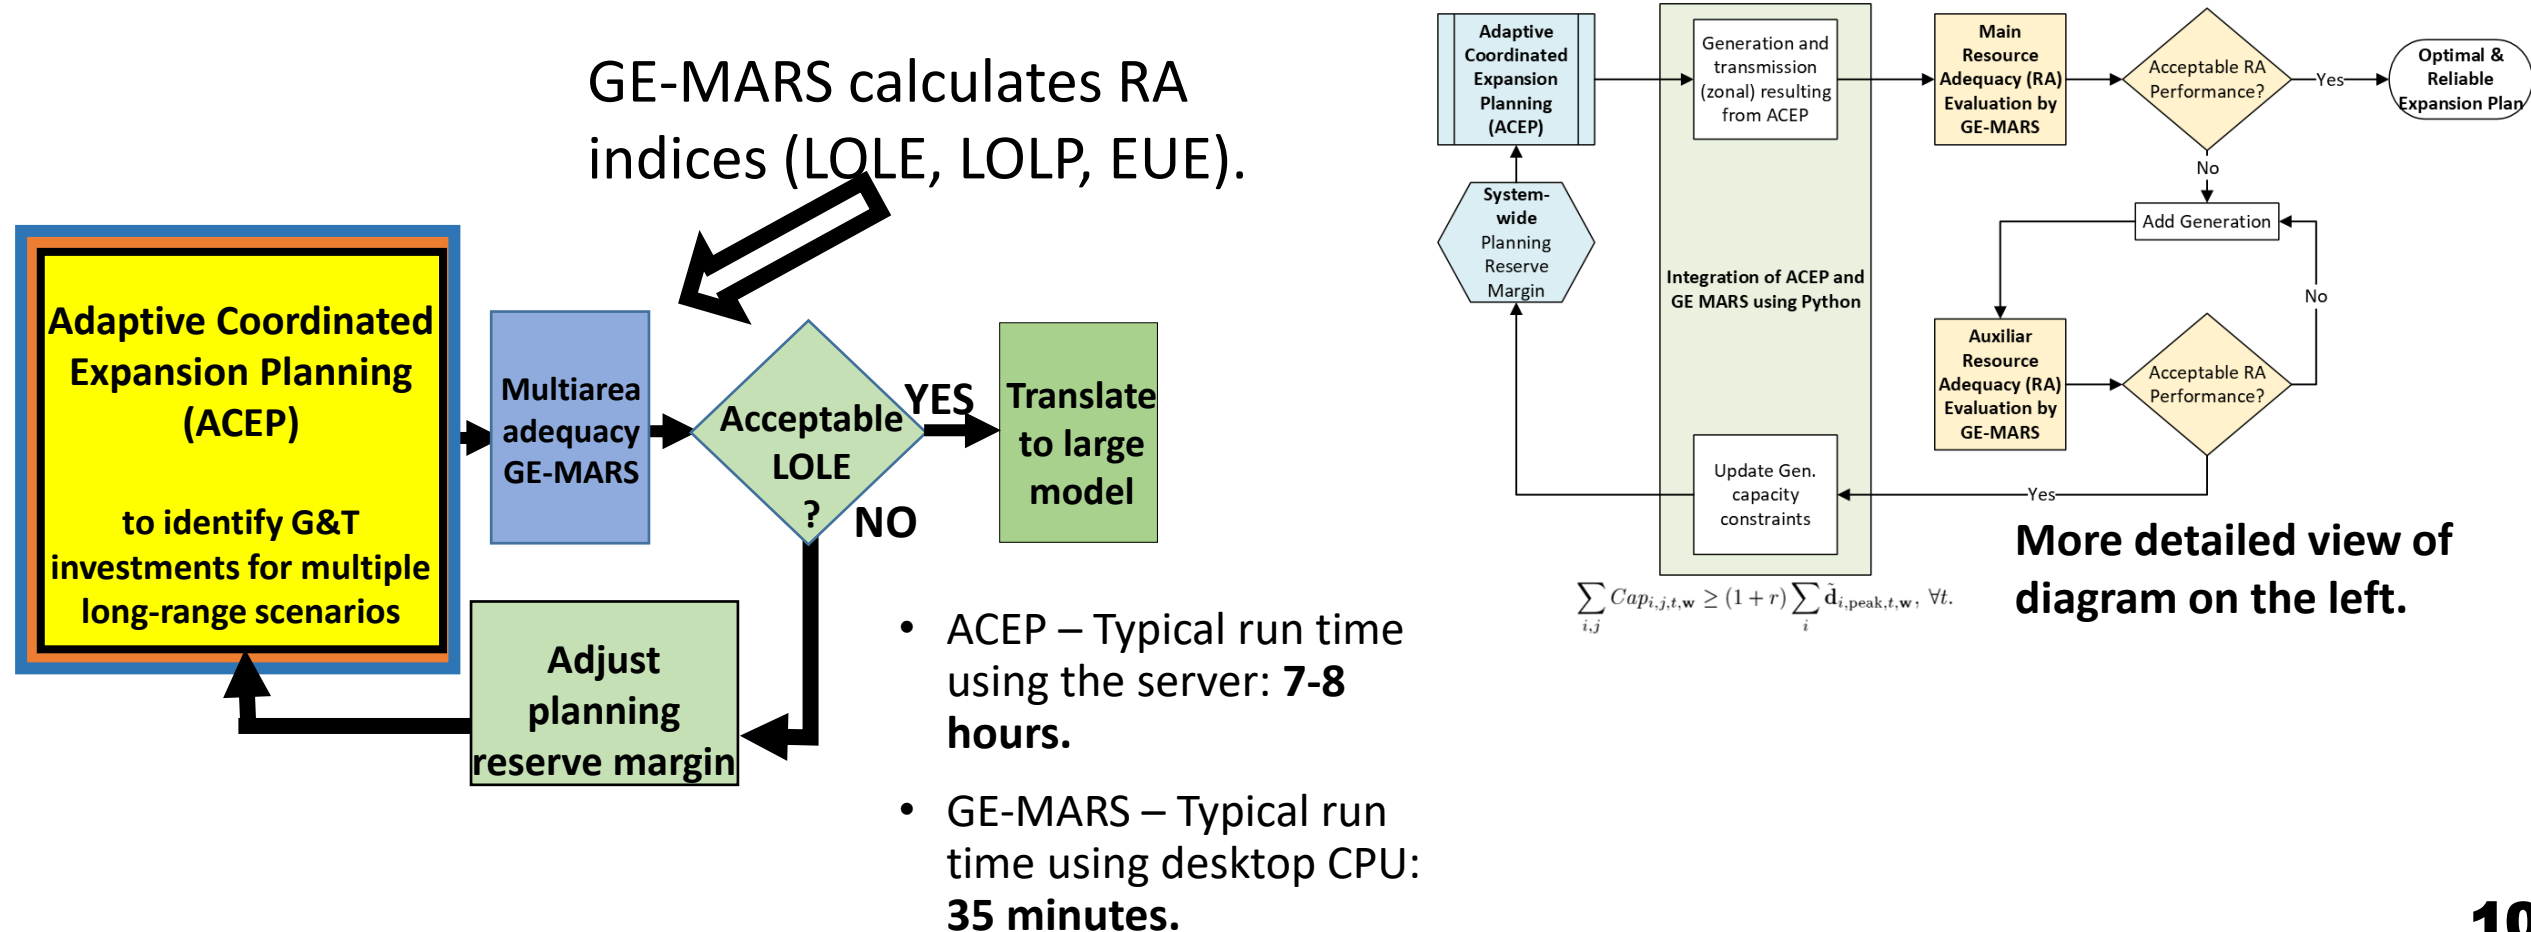

Transmission:

- 230, 345, 765 kV AC
- P2P HVDC overhead
 - ± 600 kV
 - ± 800 kV
- P2P ± 525 HVDC ugnd
- Multi-terminal HVDC

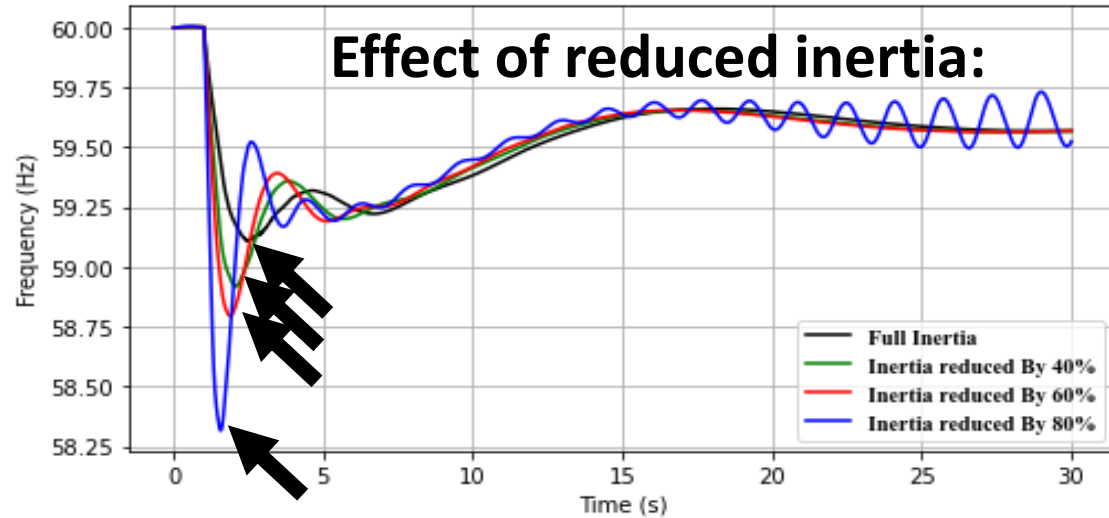

Recent work – resource adequacy (RA)

We desire ACEP result to satisfy RA requirement (LOLE \leq 1day in 10 years).
Embedding RA calculations within ACEP causes excessive solve times.

Solution: Iteratively run ACEP and externally perform RA, then modify ACEP PRM to correct.

Recent work – inertial constraints

Future: More IBR, less synch. machines

Minimize InvestCost+OpCost

Subject to

Operational constraints

$Inertia \geq \text{minimum inertia}$

- Inertia comes from synchronous machines.
- It may also come from wind & solar if equipped with inertial emulation.

Recent work – providing grid services

Deviation-based reserves

- Regulation reserves
- Ramping reserves
- Short-term reserves

Product	Requirement (MW)	
Short-Term Reserve		30 Minute Response
Market-Wide	~ 3,600	
Sub-Regional	dynamic	
Local	dynamic	
Ramp		10 Minute Response
Up Ramp	0-1,800	
Down Ramp	0-1,800	
Contingency Reserves		10 Minute Response
Spinning Reserve	930	
Supplemental Reserve	1,105	
Regulation	400	5 Minute Response
Energy		

Histograms (distributions) on netload deviations widen with increase in wind&solar.

➔ We model requirements on deviation-based reserves as a function of wind&solar.

➔ Conventional synchronous machines provide reserves; certain load types can as well.

Recent work – new nuclear

Natrium by TerraPower

Prism by GE HITACHI

SMR-160 by Holtec International

	Natrium by TerraPower [3], [4], [5], [6]	VOYGR by Nuscale [15],[16],[17],[18]	Prism by GE Hitachi [11],[12],[13],[14]	SMR-160 by Holtec International [9],[10],[19]	BWRX-300 by GE Hitachi [1], [2], [8]	ARC-100 by ARC Clean Technology [7]
Reactor Type	Sodium fast Reactor	Pressurized Water-Cooled Reactor	Sodium fast Reactor	Pressurized Water Reactor	Boiling Water Reactor	Sodium Cooled Reactor
Power Output (MWe)	345	308 (4 modules), 462 (6 modules), 924 (12 modules)	311	160	300	100
Overnight Cost (first in class)	\$4 billion	\$9 billion	\$3-4 billion	\$1 billion	\$1 billion	\$ 400 million
Overnight Cost (nth type)	\$1 billion	\$3.6 billion	\$1.5-2 billion	\$1 billion	\$700 million	\$400 million
Estimated Construction Period	36 months	36 months	36 months	36 months	27 months	34 months
Refueling Cycle	18 months	12-24 months	12-24 months	24 months	12-24 months	20 years
Benefit-to-cost Ratio		0.77777778				
Operational Date	2030	2029	2026	2029	2028	2030
Important Features	Thermal energy storage	Passive cooling, scalable output	Modular construction, passive cooling	Air-cooled condensers for flexible deployment in various climates	Natural circulation cooling	Passive Cooling, Cheaper Metallic Fuel
LCOE (\$/MWh)	\$50-\$60	\$64	\$58-60	\$81.50	\$35-50	\$55
Thermal Efficiency	41%	30%	37%	30%	34.50%	38%

Identifying Revenues

Revenue streams from wind & solar

- Land lease payments
- Property taxes

These revenue streams are implicit in the cost data modeled in ACEP.

But they are identified explicitly as a function of each ACEP solution.

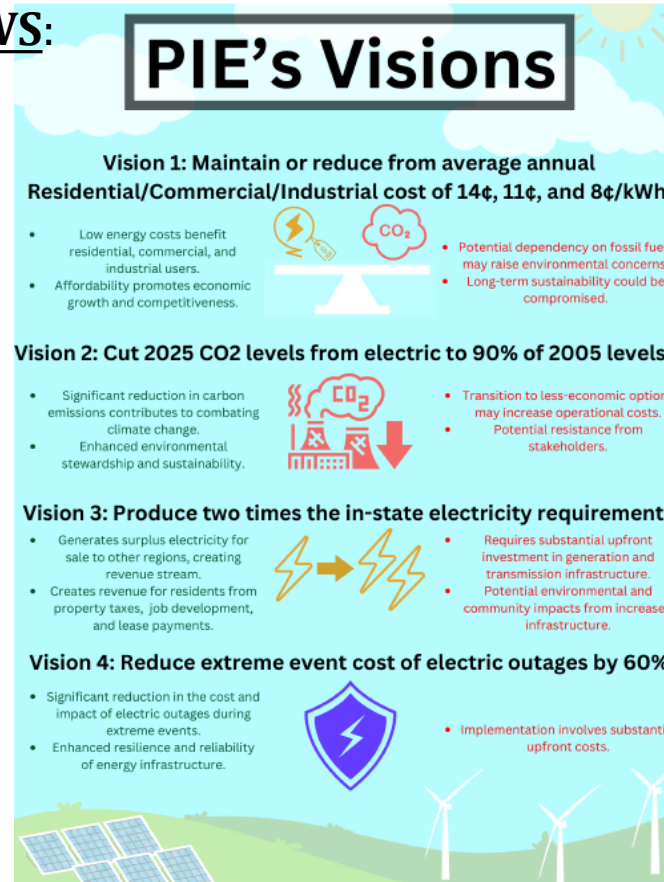

Recent work: 2-step process for learning Iowa's preferences

SOCIO-POLITICAL-ECONOMIC DECISIONS TO BE MADE BY IOWANS:

- What CO₂ level should we reach?
- What resilience level should we obtain?
- How much energy should we export?

STEP 1: CONDUCT 16 INTERVIEWS:

1. Small farm, no wind farm
2. Small farm, wind farm
3. Large farm, no wind farm
4. Large farm, wind farm
5. Industry professional
6. Community advocate
7. Environmental advocate
8. Media energy expert
9. Metro county supervisor
10. Rural county supervisor
11. Mid-size county supervisor
12. Local Business Owner
13. Young Adult
14. Young Adult
15. Senior Citizen
16. Senior Citizen

STEP 2: DEVELOP SURVEY BASED ON INTERVIEWS:

→ We will survey 5000

(i) energy-savvy and (ii) wind/-solar-affected Iowans.
Survey to be completed by the CyBIZ Lab, Iowa State Universities' student consulting program.

Comments:

- Have learned that peer-pressure is important!
- This is not in our PIE project budget. Looking for partners to help offset some of \$6000 cost.

Next Steps

1. Generate results from ACEP/GE-MARS work.
2. Embed inertial constraints into ACEP.
3. Test ACEP reserve modeling functionality, including load provision.
4. Complete network model and begin generating ACEP-results.
5. Complete 15 interviews, summarize in a report, conduct survey.
6. Next PAB meeting: September, 2024.

Appendix

A HIGH-FIDELITY NETWORK REDUCTION PROCESS FOR EXPANSION PLANNING

Internal system is Iowa 345 and 230 kV networks.
 External system 1 is Iowa network below 230 kV.
 External system 2 is MISO system close to but external to Iowa.
 External system 3 is the rest of the MISO system.
 External system 4 is non-MISO EI network close to MISO.
 External system 5 is non-MISO EI network far from MISO

Divide system into internal subsystem and 1 or more external subsystems

1

Use MST and key branches in internal system to divide it into zones

2

Steps 3-6 applied separately to each external system and to each zone.

Bus selection based on GA. 3

Ward eliminate internal load buses for each zone

4a

Estimate equiv. branch capacities and cost using method with existing buses

4b

Gen buses which share same list of direct-connected boundary buses are aggregated. Branch impedances are computed using least squares to maintain same Thev impedance looking from 1 boundary bus to another.

5a: topology-based aggregation (gen only)

Internal system topology check

Gen Aggregation of zone i

Add branches if some zones are too large for topology-based aggregation

Estimate equiv. branch capacities & cost using method with new buses

6a

Trim external region until current MISO server can effectively run capacity estimation formulation.

Preprocess oprtnl data, including:

- Gen econ data
- Fuel cost data
- Load data
- Trim & map

0

6b

Estimate equiv. branch capacities & cost using method with new buses

For agg of boundary bus and gens

5b: PTDF-based aggregation (gen & boundary buses)

Apply quotient graph method upon all buses of zone i

Reduce PTDF column distance threshold

Modeling – DER Representation

Model one N-seg feeder
at each trans load bus.

N=3 segments

DER = EE, DR, D-PV, microT, & D-storage

Enables multi-segment loss representation & investment without increasing model size too much. Can choose N according to computation/fidelity needs.
